1.QSAR identifier

1.1.QSAR identifier (title):

QSAR for honey bee acute contact toxicity (amine derivatives)

1.2.Other related models:

This model is part of a set of models developed for different types of compounds. The following models were also developed:

QSAR for honey bee acute contact toxicity (amide derivatives)

QSAR for honey bee acute contact toxicity (ester derivatives)

QSAR for honey bee acute contact toxicity (ether derivatives not containing amide groups)

1.3.Software coding the model:

QSARModel 3.5.0 Molcode Ltd. Turu 2, Tartu, 51014, Estonia http://www.molcode.com

2.General information

2.1.Date of QMRF:

25.05.2009

2.2.QMRF author(s) and contact details:

Molcode model development team, Molcode Ltd. Turu 2, Tartu, 51014, Estonia models@molcode.com http://www.molcode.com

2.3.Date of QMRF update(s):

2.4.QMRF update(s):

2.5.Model developer(s) and contact details:

Molcode model development team Molcode Ltd Turu 2, Tartu, 51014, Estonia models@molcode.com http://www.molcode.com

2.6.Date of model development and/or publication:

25.05.2009

2.7.Reference(s) to main scientific papers and/or software package:

[1]Karelson M, Dobchev D, Tamm T, Tulp I, Jänes J, Tämm K, Lomaka A, Savchenko D & Karelson G (2008). Correlation of blood-brain penetration and human serum albumin binding with theoretical descriptors. ARKIVOC 16, 38-60.

2.8.Availability of information about the model:

Model is proprietary, but the training and test sets are available.

2.9.Availability of another QMRF for exactly the same model:

None to date.

3.Defining the endpoint - OECD Principle 1

3.1.Species:
Honey bee

3.2.Endpoint:
6.Other 6.6.Other

3.3.Comment on endpoint:
Honey bee acute contact toxicity.

3.4.Endpoint units:
log(µmol/org)

3.5.Dependent variable:
log(LD50)

3.6.Experimental protocol:
Honeybee acute contact toxicity was determined using the OECD Test Guideline 214 (EU C.17). The acute contact toxicity test is carried out to determine the inherent toxicity of pesticides and other chemicals to bees. Acute contact toxicity is presented as the median lethal dose (LD50) at which half of the population of honeybee died after exposure for 48 h.

3.7.Endpoint data quality and variability:
Toxicity data for EPA - Office of Pesticide Programs database (http://www.epa.gov/pesticides/) are drawn from several sources and then reviewed:

(i) Ecotoxicological studies conducted by commercial laboratories and submitted by pesticide companies in support of their products. EPA's Office of Compliance and Monitoring conducts periodic audits of these laboratories.

(ii) Studies conducted by US-EPA, USDA, and USFWS laboratories over the last 25 years.

(iii) Published data considered to meet their guideline criteria for acceptable data.

Inorganic compounds and mixtures in which components have different molecular weight or connectivity (i.e., substances with different chemical identity) were eliminated from the original EPA dataset. However, mixtures of stereoisomers were kept, because they are super-imposable using common 2D descriptors. Data for LC50 48 h exposure of honeybee were then pruned as follows:

(i) Eliminating studies with an a.s.<85% purity.

(ii) Those identified as invalid where invalid studies were defined by the EPA as studies which may not be scientifically sound, or they were performed under conditions that deviated so significantly from the recommended protocols that the results will not be useful in a risk assessment.

(iii) Furthermore, only studies with actual values were kept discarding data given as higher or lower that values.

Statistics:
max value: 0.54
min value: -4.16
standard deviation: 1.05   skewness: -1.47

4.Defining the algorithm - OECD Principle 2

4.1.Type of model:
QSAR

4.2.Explicit algorithm:
Multilinear regression QSAR

Multilinear regression QSAR based on 2D and 3D quantum-chemical descriptors

Log(LD50)= 1.33 -35.4 Max electrophilic reactivity index (AM1) -0.214* RNCS Relative negative charged SA (SAMNEG*RNCG) (AM1) -4.17E-4* Reverse Wiener index

4.3.Descriptors in the model:
[1]Max electrophilic reactivity index (AM1), [1/eV]

[2]RNCS Relative negative charged SA (SAMNEG*RNCG) (AM1), [Å2]

[3]Reverse Wiener index, [-]

4.4.Descriptor selection:
Initial pool of ~1000 descriptors. Stepwise descriptor selection based on a set of statistical selection rules:

1-parameter equations: Fisher criterion and R2 over threshold, variance and t-test value over threshold, intercorrelation with another descriptor not over threshold.

2 parameter equations: intercorrelation coefficient below threshold, significant correlation with endpoint, in terms of correlation coefficient and t-test.

Stepwise trial of additional descriptors not significantly correlated to any already in the model.

4.5.Algorithm and descriptor generation:
1D, 2D, and 3D theoretical calculations.

Quantum chemical descriptors were derived from Merck Molecular Force Field (MMFFs) (water) conformational search and AM1 calculation. Model developed by using multilinear regression.

4.6.Software name and version for descriptor generation:
QSARModel 3.5.0

Molcode Ltd., Turu 2, Tartu, 51014, Estonia

http://www.molcode.com

4.7.Descriptors/Chemicals ratio:
12.7 (38 chemicals/3 descriptors)

5.Defining the applicability domain - OECD Principle 3

5.1.Description of the applicability domain of the model:
Applicability domain based on training set:

a) by chemical identity: pesticides - amine derivates

b)by descriptor value range:

Max electrophilic reactivity index (AM1) (min: 0. 0114, max: 0. 0577)

RNCS Relative negative charged SA (SAMNEG*RNCG) (AM1) (min: 0, max:13.5)

Reverse Wiener index (min: 96, max: 6550)

5.2.Method used to assess the applicability domain:
Pesticides with amine functional groups present in the structures.

Range of descriptor values in training set with ±30% confidence.

Descriptor values must fall between maximal and minimal descriptor   values of training set ±30%.

5.3.Software name and version for applicability domain assessment:

QSARModel 3.5.0

Molcode Ltd., Turu 2, Tartu, 51014, Estonia

http://www.molcode.com

5.4.Limits of applicability:

Compounds should contain amine functional group.

6.Internal validation - OECD Principle 4

6.1.Availability of the training set:

Yes

6.2.Available information for the training set:

CAS RN:Yes

Chemical Name:Yes

Smiles:No

Formula:No

INChI:No

MOL file:Yes

6.3.Data for each descriptor variable for the training set:

All

6.4.Data for the dependent variable for the training set:

All

6.5.Other information about the training set:

38 data points: 36 negative values; 2 positive values.

6.6.Pre-processing of data before modelling:

6.7.Statistics for goodness-of-fit:

R^2 = 0.838 (Correlation coefficient);

s^2 = 0.195 (Standard error of the estimate);

F = 58.8 (Fisher statistic).

6.8.Robustness - Statistics obtained by leave-one-out cross-validation:

R^2_{cv} = 0.790 (LOO)

6.9.Robustness - Statistics obtained by leave-many-out cross-validation:

R^2_{cv} = 0.787 (LMO)

6.10.Robustness - Statistics obtained by Y-scrambling:

6.11.Robustness - Statistics obtained by bootstrap:

6.12.Robustness - Statistics obtained by other methods:

ABC analysis (2:1 training : prediction) on sorted data divided into 3   subsets (A;B;C). Training set formed with 2/3 of the compounds (set A+B,   A+C, B+C) and validation set consisted of 1/3 of the

compounds (C, B, A).

average R^2 (fitting) = 0.84;

average R^2 (prediction) = 0.83.

7.External validation - OECD Principle 4

7.1.Availability of the external validation set:
Yes

7.2.Available information for the external validation set:
CAS RN:Yes

Chemical Name:Yes

Smiles:No

Formula:No

INChI:No

MOL file:Yes

7.3.Data for each descriptor variable for the external validation set:
All

7.4.Data for the dependent variable for the external validation set:
All

7.5.Other information about the external validation set:
4 data points: 4 negative values; 0 positive values

7.6.Experimental design of test set:
The full experimental dataset was sorted according to increasing values   of property and each tenth compound starting from fifth was assigned to   the test set

7.7.Predictivity - Statistics obtained by external validation:
$R^2 = 0.942$ (Correlation coefficient)

7.8.Predictivity - Assessment of the external validation set:
The descriptor values of the compounds in the test set are in the limits   of applicability.

7.9.Comments on the external validation of the model:

8.Providing a mechanistic interpretation - OECD Principle 5

8.1.Mechanistic basis of the model:
All the descriptors have negative influence to the property in absolute   scale. This means that higher descriptor values lead to structure   characteristics that make compounds more toxic. Max electrophilic   reactivity index (AM1) is related to LUMO and describes the compound's   ability to interact with electron pair donors. Electron rich parts of   the compounds are described with RNCS Relative negative charged SA   (SAMNEG*RNCG) (AM1). In both cases higher values lead to higher toxicity   due to stronger interaction contributions to the affinity. Reverse   Wiener index describes size and branching of the compound, where   branched compound have smaller value than linear ones in magnitude. Thus, the descriptor accounts for the flexibility of the compound.   Flexible compounds have higher toxicity because their binding is not as   specific as it is for stiff structures.

8.2.A priori or a posteriori mechanistic interpretation:
A priori - it was postulated that amines have different mechanism than   other compounds. The rest of the interpretation – a posteriori.

8.3.Other information about the mechanistic interpretation:

9.Miscellaneous information

9.1.Comments:

Since bees pollinate plants and fruit trees, the influence of pesticides on bees is an important ecologic question.
